

a Strain measure: engineering vs Green-Lagrange

The same one-dimensional motion; the 0.02 gap is a definitional difference and involves no tracking error.

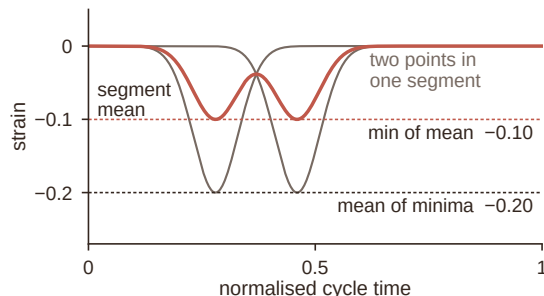

c Which peak? Three readouts of one curve

End-systolic, peak-systolic and whole-cycle peaks diverge with dyssynchrony or post-systolic shortening.

Conceptual and analytic schematics with no measured scale.

b Coordinate axes and myocardial layer

Endocardial, transmural and epicardial values differ; local axes depend on the reference frame and centreline, and a 2D slice omits through-plane terms.

d Order of spatial and temporal aggregation

Averaging before or after selecting the temporal peak gives different values for the same field.
