a Prescribed scar: radial strain 0.95 → 0.30

Infarct case EF 49%: remote tissue compensates for the scar.

b Slice-mean error: Ecc small, Err biased low

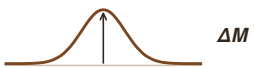

myocardial Dice, all phases	**0.82**
displacement error	**1.0 ± 0.9 mm**
EF, NOR / DCM / HCM / infarct	**51 / 34 / 41 / 49%**

Case-level means over whole slices; errors inside the scar were not reported. Means are descriptive; SD overlap does not test between-case differences.

c Scar-level recovery is not quantified in the inspected results

Magnitude ○

scar-level error not reported; slice means: Ecc error small, Err under-estimated

Location ○

myocardial Dice only; no lesion-centroid error

Extent ○

one fixed scar geometry; extent recovery not measured

Timing ○

scar-level peak-time error not reported

○ not reported at the attribute's own (scar) level

— reference profile (schematic)
