a The measure alone shifts –0.20 to –0.18

$e \rightarrow E$	
–0.30	**–0.255**
–0.20	**–0.18**
–0.10	**–0.095**
+0.10	**+0.105**
+0.20	**+0.22**

Same one-dimensional motion: the 0.02 gap is a definitional difference and involves no tracking error.

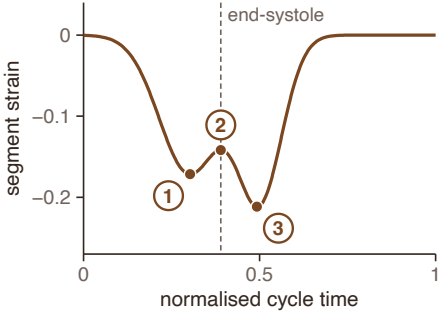

b Layer, frame and axes must be stated

Choices to report	
layer	**endo · mid · epi**
reference	**ED or ES frame**
axes	**centroid / centreline**
slice	**2D: no through-plane**

Layer values differ; local axes depend on the reference frame and centreline, and a 2D slice omits through-plane terms.

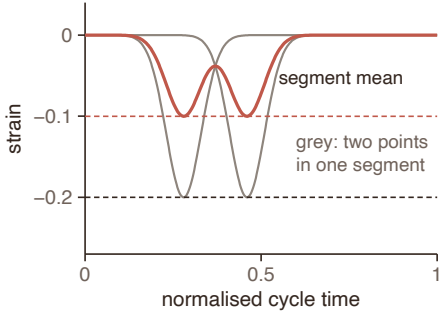

c One curve, three peaks: –0.14 to –0.21

readout	
1 peak systolic	**–0.17**
2 end-systolic	**–0.14**
3 post-systolic	**–0.21**

End-systolic, peak-systolic and whole-cycle peaks diverge with dyssynchrony or post-systolic shortening.

d Aggregation order: –0.10 vs –0.20

readout	
min of mean	**–0.10**
mean of minima	**–0.20**
difference	**0.10**

Averaging before or after selecting the temporal peak gives different values for the same field.
